definitions & refresher

- ***density*** <u>or</u> ***concentration*** of particles, in space

- *Coulomb*'s ***Force***, Electric ***Field*** and its ***Potential***

- ***mobility*** of a particle in a fluid

- ***flux*** of particles through space

Some math concepts useful to us…

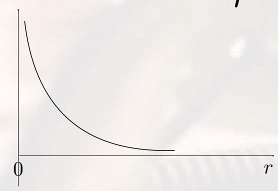
Richard P. Feynman, *The Character of Physical Law*

"Mathematics is a language plus reasoning;
it is like a language plus logic.
Mathematics is a tool for reasoning."

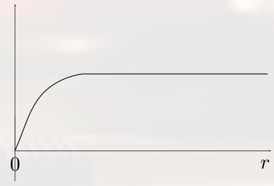
"If you want to learn about nature, to appreciate nature,
it is necessary to understand the language that she speaks in!"

Graph of some notable functions

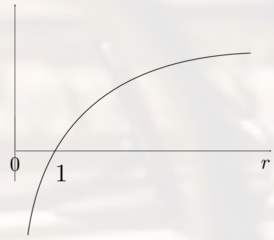
$$f(r) = \frac{1}{r}$$



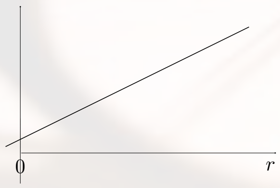
$$f(r) = (1 - e^{-\alpha r})$$



$$f(r) = ln(r)$$



$$f(r) = m\ r\ +\ p$$



Concept of (first) *derivative* of a mathematical function

$$f(x) = constant \qquad \frac{df(x)}{dx} =$$

$$f(x) = \frac{1}{x} \qquad \frac{df(x)}{dx} =$$

$$f(x) = ln(x) \qquad \frac{df(x)}{dx} =$$

Derivative **of a** ***sum*** **of functions ==>**

$$\frac{d[f(x) + g(x)]}{dx} =$$

Derivative of a ***composite*** **function ==>**

$$\frac{dG(H(x))}{dx} = \qquad \frac{d}{dx} ln(c(x)) =$$

Concept of (first) *derivative* of a mathematical function

$$f(x) = constant \qquad \frac{df(x)}{dx} = 0$$

$$f(x) = \frac{1}{x} \qquad \frac{df(x)}{dx} = -\frac{1}{x^2}$$

$$f(x) = ln(x) \qquad \frac{df(x)}{dx} = \frac{1}{x}$$

***Derivative* of a *sum* of functions ==> sum of the derivatives!**

$$\frac{d[f(x)+g(x)]}{dx} = \frac{df(x)}{dx} + \frac{dg(x)}{dx}$$

Derivative of a *composite* function ==> *chain* rule!

$$\frac{dG(H(x))}{dx} = \frac{dG(H)}{dH}\frac{dH(x)}{dx} \qquad \frac{d}{dx}ln(c(x)) = \frac{1}{c(x)}\frac{dc(x)}{dx}$$

Concept of the *definite integral* **(i.e. fundamental theorem)**

$$\int_a^b \frac{1}{x}dx = ln(x)|_a^b = \qquad\qquad =$$

Concept of (Taylor's) *expansion* into a *series of polynomials*

$$f(x_0 + h) \approx$$

Concept of the *definite integral* **(i.e. fundamental theorem)**

$$\int_a^b \frac{1}{x} dx = ln(x)|_a^b = ln(b) - ln(a) = ln(b/a)$$

Concept of (Taylor's) *expansion* into a *series of polynomials*

$$f(x_0 + h) \approx f(x_0) + \frac{df(x)}{dx}|_{x_0}\ h$$

First-order ordinary differential equation,
non-homogenous (i.e. with constant "*external input term*")

$$\frac{df(x)}{dx} = -af(x) + B \qquad\qquad f(x) =$$

First-order ordinary differential equation,
non-homogenous (i.e. with constant "*external input term*")

$$\frac{df(x)}{dx} = -af(x) + B \qquad\qquad f(x) = ke^{-ax} + B/a$$

The Prefixes Used with SI Units

Prefix	Symbol	Meaning	Scientific Notation
exa-	E	1,000,000,000,000,000,000	10^{18}
peta-	P	1,000,000,000,000,000	10^{15}
tera-	T	1,000,000,000,000	10^{12}

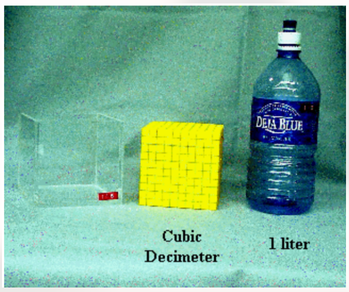
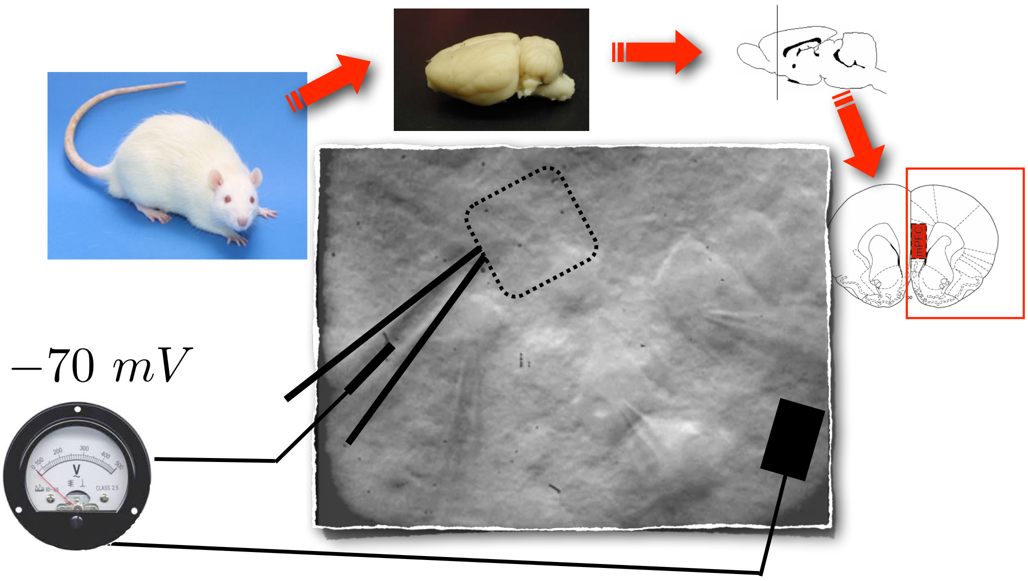
$$1\ litre\ =\ 1\ dm^3$$



Why are we bothering with biophysics of electrolytes, membranes, electrodes, etc???

Understand why/how there is a membrane elec. potential (*“at rest”*)

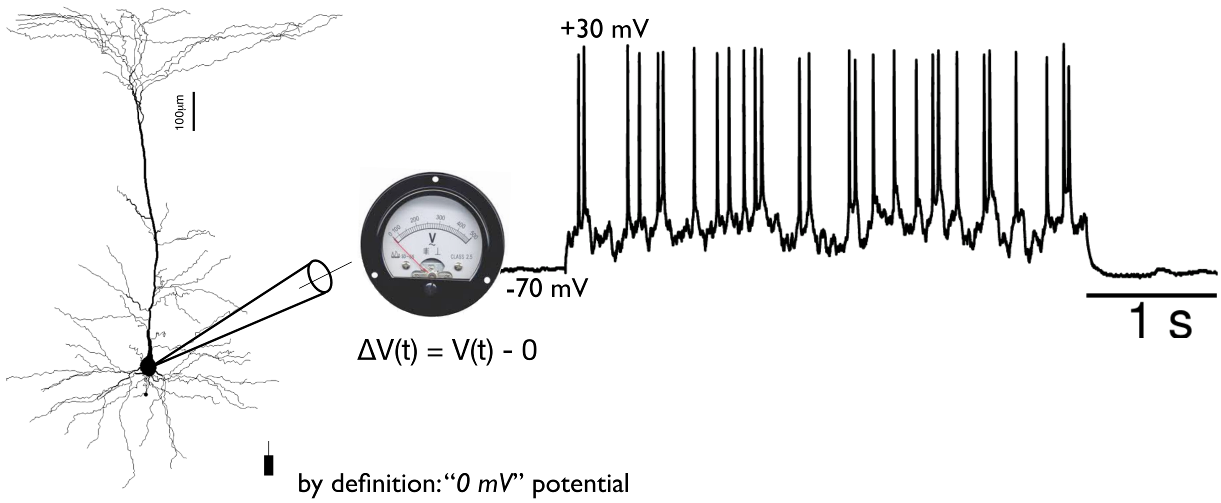
(in every cell, not just in nerve cells!)



Why are we bothering with biophysics of electrolytes, membranes, electrodes, etc???

Essential to understand the generation of ePhys signals

***excitable* electrical properties** of the cell membrane of neurons

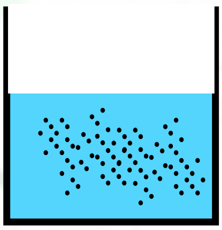


Biophysics
definitions & refresher

- ***density*** <u>or</u> ***concentration*** of particles, in space
- *Coulomb*'s ***Force***, Electric ***Field*** and its ***Potential***
- ***mobility*** of a particle in a fluid
- ***flux*** of particles through space

"***density***" and "***concentration***" are.. the same!

(e.g. aiming at describing a solute in an electrolyte)



density of molecules per unit of volume

$$\rho(x,y,z,t) = \frac{number\ in\ a\ small\ Vol}{Vol} = \frac{num}{cm^3}$$

concentration of molecules per liter

$$C(x,y,z,t) = \frac{moles}{litre} = Molarity$$

$$1\ mole = \underbrace{6.022\ 10^{23}}_{\text{Avogadro's number}}\ molecules = \underbrace{M.W.}_{\text{Molecular Weight}}\ (grams)$$

$$1\ litre = 1\ dm^3 = 1000\ cm^3$$

$$[Na^+] = 1mM = 10^{-3}\frac{moles}{litre} =$$

$$10^{-3}\frac{6\ 10^{23}}{1000\ cm^3} = 6\ 10^{17}\frac{ions}{cm^3}$$

REMEMBER

...as there are atoms in 12 grams of pure carbon-12 (^{12}C), the isotope of carbon.

Exercise for you

- how many ions in a spherical cell, filled with a 150mM K-solution ?
- if all distribute near the membrane, which is the ions surface density?

$$Volume = \frac{4}{3}\pi r^3 = \frac{4}{3}\pi 125 \mu m^3 \approx 523 \mu m^3$$

$$523\ 10^8 ions$$ *50 billions*

$$Area = 4\pi r^2 = 4\ \pi 25 \mu m^2 \approx 314 \mu m^2$$

$$1.6\ 10^8 ions/\mu m^2$$ *(shell)*

$$[K^+] = 150mM = 150\ 6\ 10^{17} ions/cm^3$$
$$= 900\ 10^{17}\ ions/(10^{12}\ \mu m^3)\ \approx 10^8 ions/\mu m^3$$

Biophysics

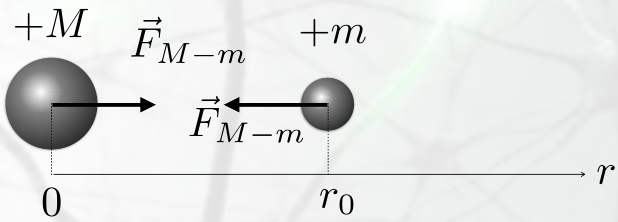
1642 –1726

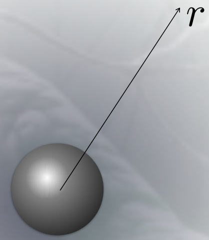


$$|\vec{F}_{m-M}| = G\,\frac{M\ m}{{r_0}^2} \qquad N$$

Vector fields!

$$|\vec{E}_M| = G\,\frac{M}{{r_0}^2} \qquad N/Kg$$

Vector fields!



$$\vec{F}_{m-M} = m\ \vec{E}_M \qquad N$$

Vector fields!

Gravitation *conserves* mechanical energy

work done - i.e. energy transferred - to move an object in the field depends on initial & final positions, not on the trajectory

(for “conservative” <u>vector</u> fields...)

$$\vec{E} = -\vec{\nabla} V \qquad \vec{E} = -\frac{d}{dr}V \qquad V(r)$$

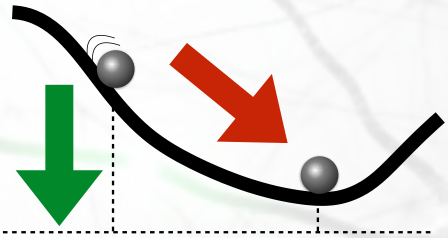
V is a <u>scalar</u> field and it is ...*defined irrespectively of a (reference) constant!!*

$$V_M(P) = -G\frac{M}{r}$$

$$|\vec{E}_M| = -\frac{d}{dr}V_M \qquad |\vec{E}_M| = G\,\frac{M}{{r_0}^2}$$

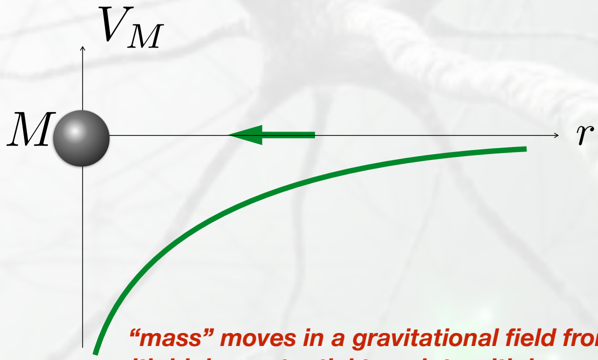
Gravitation *conserves* mechanical energy

work done - i.e. energy transferred - to move an object in the field depends on initial & final positions, not on the trajectory



$$V_M(P) = -G\frac{M}{r}$$

$$|\vec{E}_M| = -\frac{d}{dr}V_M$$



"mass" moves in a gravitational field from point with higher potential to points with lower potential

Gravitational (field) potential = ***amount*** *of gravitational potential* ***energy*** *that a unitary point mass would have if located at that point in space;*
= ***work done*** *by the gravitational field in* ***carrying a unit mass*** *from* ∞ *to that point.*

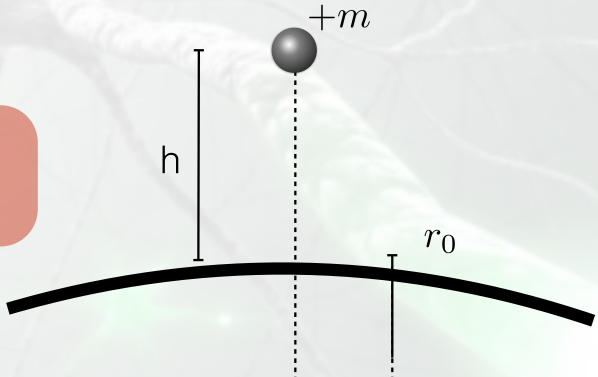
$$V_M(P) = -G\frac{M}{r}$$

V is a <u>scalar</u> field and it is *...defined irrespectively of a (reference) constant!!*

$$V_M(r_0 + h) \approx -G\frac{M}{r_0} + G\frac{M}{r_0^2}\,h$$

$$m << M$$

$$\boxed{\Delta V \approx g\;h}$$



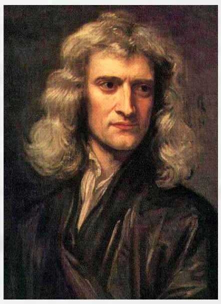
Biophysics
definitions & refresher

- ***density*** <u>or</u> ***concentration*** of particles, in space
- *Coulomb*'s ***Force***, Electric ***Field*** and its ***Potential***
- ***mobility*** of a particle in a fluid
- ***flux*** of particles through space

Coulomb's law & Electric Potentials
electric (vector) *field*, and (scalar) electric *potential*

1736 –1806

$>$



1642 –1726

~1'000'000'000'000'000'000'000'000'000'000'000'000'000

~39 orders of magnitude stronger
than gravitation force

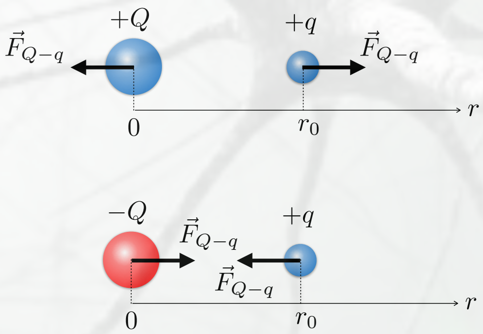
(between charged elementary particles)

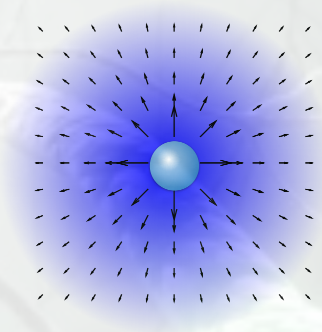
Electrostatic Force & Electrostatic Field

$$|\vec{F}_{q-Q}| = \frac{1}{4\pi\epsilon_r\epsilon_0}\frac{Q\,q}{r_0^2} \qquad N$$

$$|\vec{E}_Q| = \frac{1}{4\pi\epsilon_r\epsilon_0}\frac{Q}{r_0^2} \qquad N/C = Volt/m$$

$$\vec{F}_{q-Q} = q\,\vec{E}_Q \qquad N$$





$$\epsilon_0 = 8.85...10^{-12}F/m$$

Electrical permittivity of free space (vacuum):
measure of the resistance of the medium to the formation of an electric field

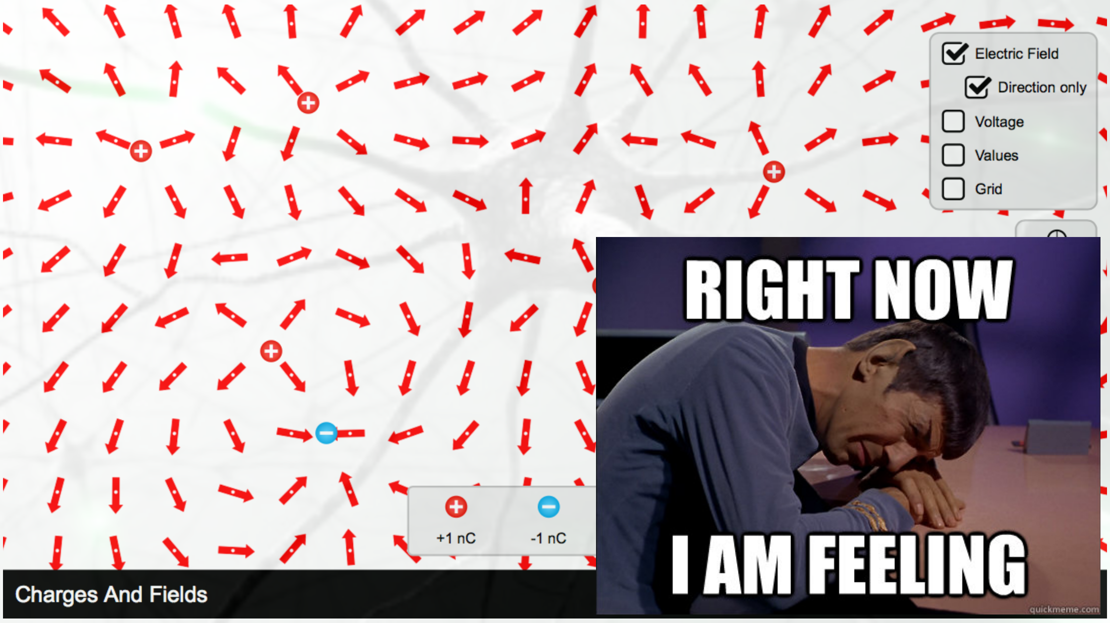
$\epsilon_R = 1$	**Relative permittivity of vacuum**
$\epsilon_R \approx 1$	**Relative permittivity of air**
$\epsilon_R = 80 \quad (at\ 20^oC)$	**Relative permittivity of water**
$\epsilon_R = 7$	**Relative permittivity of phospholipids**

$$e = 1.602...10^{-19}C$$

Electrical charge is quantised:
always integer multiple of the charge of the proton (the electron)

Vector fields

$$\vec{E}(x,y,z,t) = \{E_x(x,y,z,t); E_y(x,y,z,t); E_z(x,y,z,t)\}$$



From vectors to scalar quantities?

(for "conservative" vector fields...)

$$\vec{E} \;=\; -\vec{\nabla}V \qquad\qquad \vec{E} = -\frac{d}{dr}V$$

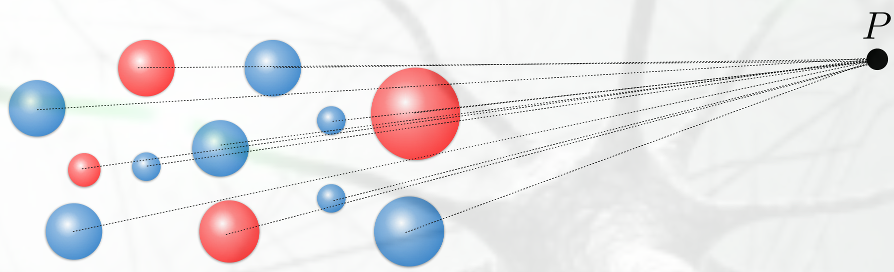
V is a scalar field and it is ...*defined irrespectively of a (reference) constant!!*

$$V_Q(P) = \frac{1}{4\pi\epsilon_r\epsilon_0}\frac{Q}{r}$$

Electric or electrostatic (field) potential = ***amount*** *of electric potential* ***energy*** *that a unitary electric point-charge would have if located at that point in space;*
= ***work done*** *by an electric field in* ***carrying a unit positive*** *charge from* ∞ *to that point.*

REMEMBER

Superposition of the effects

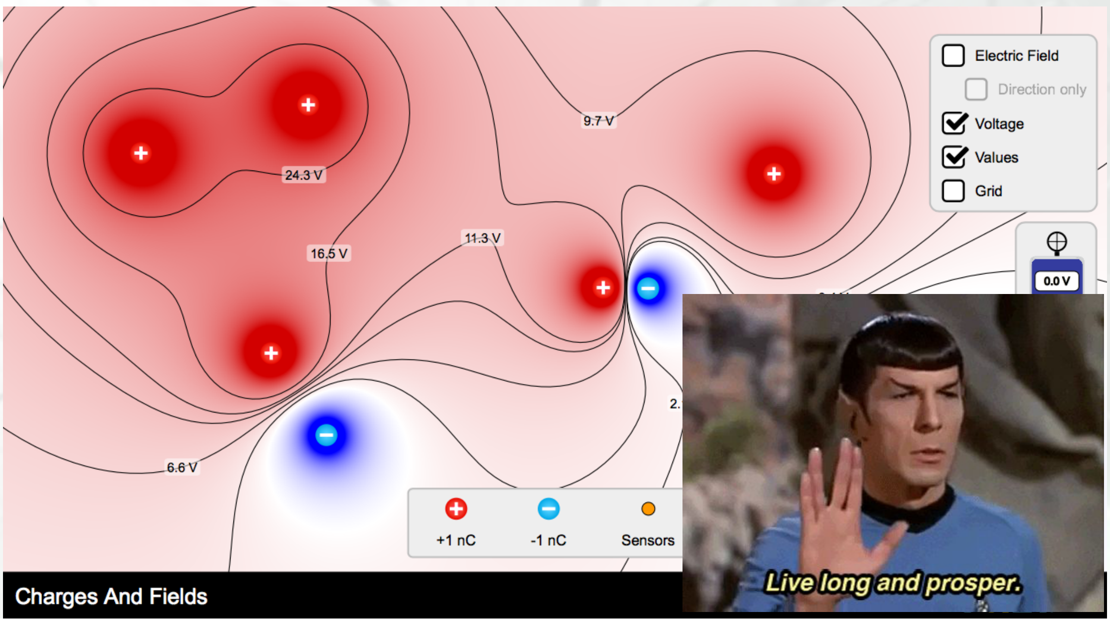


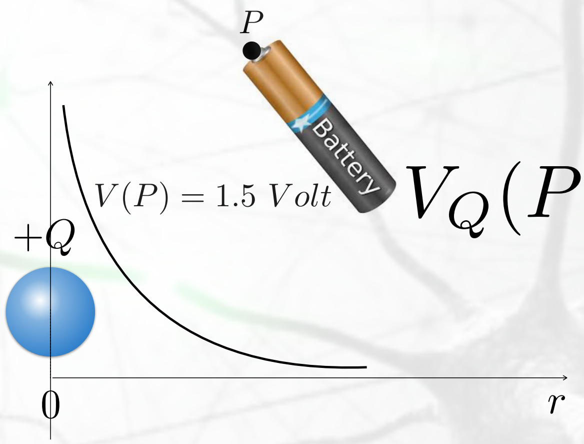
$$V_{total}(P) = \frac{1}{4\pi\epsilon_r\epsilon_0}\left(\frac{Q_1}{r_{P-Q_1}} + \frac{Q_2}{r_{P-Q_2}} + \ldots + \frac{Q_M}{r_{P-Q_M}}\right)$$

It is like the *weighted sum* of the inverse of the distances…

Scalar fields

$$V(x, y, z, t)$$





$$V_Q(P) = \frac{1}{4\pi\epsilon_r\epsilon_0}\frac{Q}{r}$$

A **positive** charge (+q) moves from points with higher electrostatic potential to points with lower electrostatic potential (+Q).

A **negative** charge (-q) moves from points with lower electrostatic potential to points with higher electrostatic potential (+Q).

Elementary Biophysics

- Def. of ***density*** and of ***concentration*** of particles
- *Coulomb*'s ***Force***, Electric ***Field*** and ***Potential***
- Def. of ***mobility*** of a particle in a fluid
- Def. of ***flux*** of particles

Mobility *u* of an **particle** in an aqueous **solution**, under an **external force field**

• **Stokes's Law**

a continuous viscous medium (say a fluid) exerts a frictional force, ***opposing*** *and* ***proportional*** *to the* ***velocity*** $v(t)$ *of (very small) particles moving into it*

⇒ Particles moves with velocity proportional (by *u*) to the external force field

$$F_{ext} + F_{friction} = m \frac{dv(t)}{dt}$$ Newton's second law

$$F_{friction} = -\lambda\, v(t)$$ Stokes' law

$$v(t) = k\, e^{-\frac{\lambda}{m}t} + \frac{F_{ext}}{\lambda}$$ The usual, boring, first-order, … o.d.e.!

$$\frac{\lambda}{m} >> 1 \qquad v(t) \approx \frac{F_{ext}}{\lambda} = u\, F_{ext}$$

"when it rains, drops do NOT accelerate until they get so fast to break your head!"

Mobility *u* of a charged **particle** in an aqueous **solution**, under an **external force field**

$$v(t) \approx \frac{F_{ext}}{\lambda} = u\, F_{ext}$$

our definition
(also called "absolute mobility")

$$v(t) \approx \frac{E_{ext}}{\lambda} = \hat{u}\, E_{ext} = \hat{u}\, \frac{F_{ext}}{|z|\, q}$$

alternative definition
(also called "electrical mobility")

$$[u] = \frac{m}{s\ N}$$

$$[\hat{u}] = \frac{m\ C}{s\ N} = \frac{m^2}{s\ V}$$

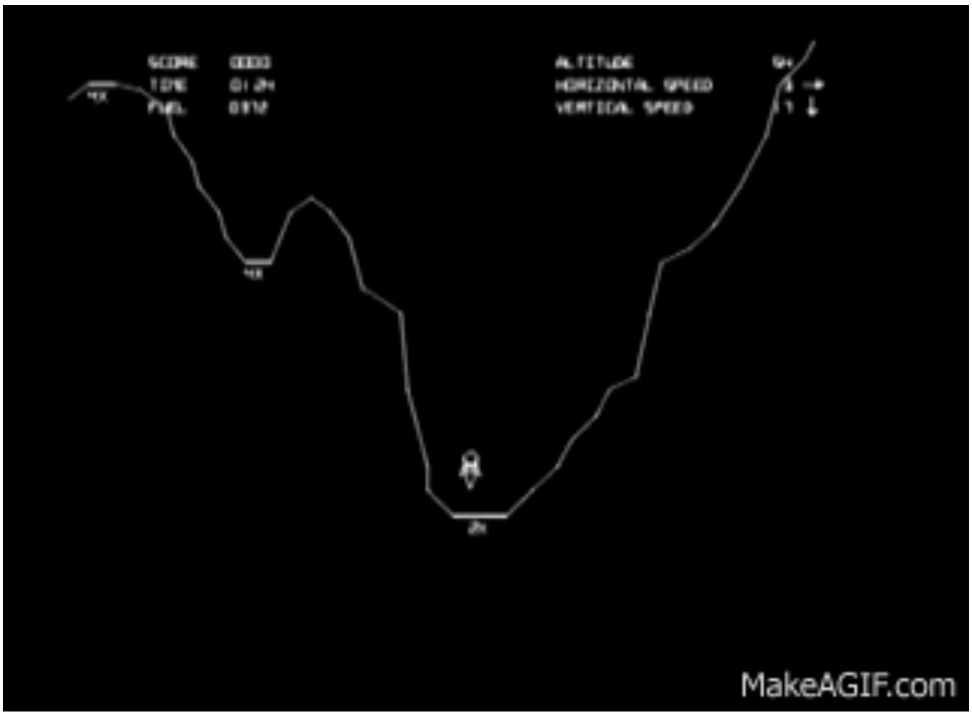
$$\boxed{u = \frac{\hat{u}}{|z|\, q}}$$

BEWARE OF THE UNITS, WHEN LOOKING AT MOBILITY VALUES

Mobility *u* - numerical values (in water, at 25 °C)

$$[\hat{u}] \ = \ \frac{m\ C}{s\ N} \ = \ \frac{m^2}{s\ V} \qquad\qquad [u] \ = \ \frac{m}{s\ N}$$

K^+	*7.61×10⁻⁸ m²/(V·s)*	*4.75×10¹¹ m/(N·s)*
Na^+	*5.19×10⁻⁸ m²/(V·s)*	*3.24×10¹¹ m/(N·s)*
Cl^-	*7.9×10⁻⁸ m²/(V·s)*	*4.93×10¹¹ m/(N·s)*
Ca^{2+}	*6.16×10⁻⁸ m²/(V·s)*	*3.84×10¹¹ m/(N·s)*



Elementary Biophysics

- Def. of ***density*** and of ***concentration*** of particles
- *Coulomb*'s ***Force***, Electric ***Field*** and ***Potential***
- Def. of ***mobility*** of a particle in a fluid
- Def. of ***flux*** of particles

"**Flux**" *J* of particles distributed/concentrated in solution

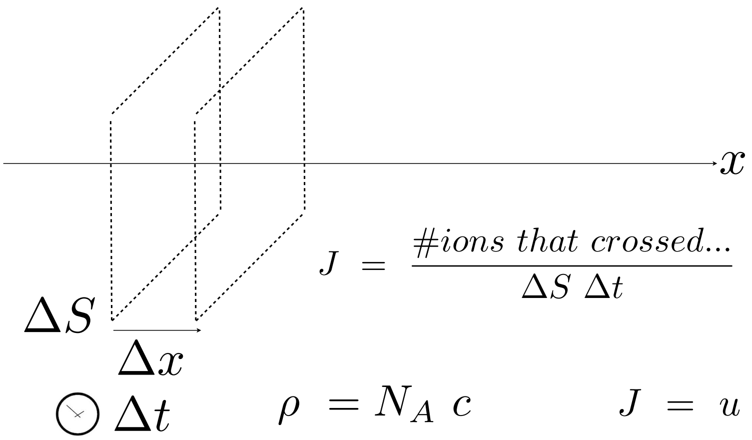
moving in one-dimension with some **velocity *v* (under external force field)**

$\rho(x, y, z, t)$ $1/m^3$

$c(x, y, z, t)$ mM

$$1\ \frac{mol}{m^3} = 1 \frac{mmol}{l} = 1\ mM$$

DEF: *J* = "*number of* *particles* *moving* ***through*** *a (unitary)* ***surface****, in a (unitary)* ***time interval***" (e.g. through $10^{-4}\ m^2$ and every 0.01 *s*)



$$J = \frac{\#ions\ that\ crossed...}{\Delta S\ \Delta t} = \frac{\rho\ \Delta S\ \Delta x}{\Delta S\ \Delta t} = \rho\ v \qquad \#\ particles\ m^{-2}\ s^{-1}$$

$$\rho = N_A\ c$$

$$J = u\ N_A\ c\ F_{ext} \qquad \#\ particles\ m^{-2}\ s^{-1},\ c\ in\ mM$$

(force acting on a particle)

Teorell's formula $$J = u\ c\ F_{ext} \qquad \#\ moles\ m^{-2}\ s^{-1},\ c\ in\ mM$$

(force acting on a mole)

REMEMBER

“**Flux**” J of particles distributed/concentrated in solution

moving in one-dimension with some **velocity *v* (under external force field)**

$$\rho(x, y, z, t) \qquad 1/m^3$$

$$c(x, y, z, t) \qquad mM$$

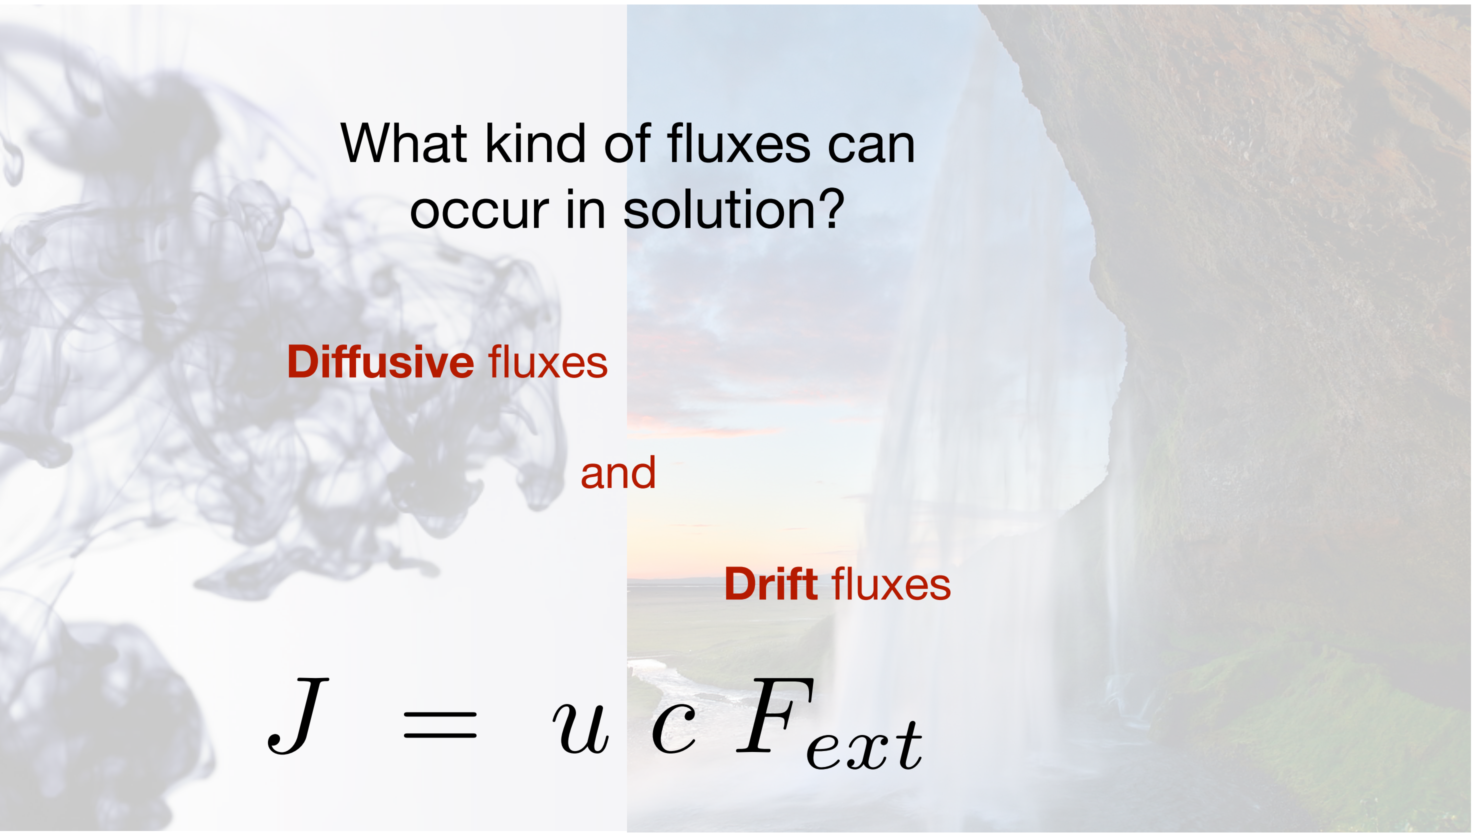
$$1\,\frac{mol}{m^3} = 1\frac{mmol}{l} = 1\ mM$$

Teorell’s formula $J = u\ c\ F_{ext}$ $\qquad \#\ moles\ m^{-2}\ s^{-1}$

Note: *if I want to express the flux **J in** unit of **mole** per unitary surface* (m^2) *and unit of time (s), and if I express the **forces in N** and the absolute **mobility in m / (s N)**,…*

*…then the **concentration c** must be expressed in **milli-Mole/litre** (e.g. 50mM —> 50).*

Because 1 liter = 1 dm^3 = 10^{-3} m^3



Charged particle (uniformly distrib.) in aqueous solution?
They *repel/attract* each other!

• positively and negatively electrically charged particles are subject to a force, proportional to the existing electric field *E* … *(which might be self-generated)*

• for conservative fields, like the electric field *E*, a potential *V* can be defined

$$\rho(x, y, z, t)$$

$$c(x, y, z, t)$$

$$F_{ext} \;=\; q_+ \; E \;=\; -q_+ \frac{dV}{dx}$$

$$J \;=\; u \; c \; F_{ext}$$

$$J \;=\; u \; c \; \left(- \; z \; N_A \; q \; \frac{dV}{dx} \right) = u \; c \; \left(-z \; F \; \frac{dV}{dx} \right)$$

drift flux

$\#\ particles\ m^{-2}\ s^{-1}$
$c\ in\ mM$

Charge of a mole =
Avogrado's number x elementary charge, F = 9.6 10 ^{4} C/mol
(the Faraday's constant)

Non-charged particle in aqueous solution? **They *diffuse*!**

Which force field?

- (non-zero) kinetic energy of water molecules at absolute temperature T >0° K
- (kinetic) energy exchanged with water molecules, due random isotropic collisions

"Monte Carlo" simulation

$$F_{ext} \;+\; F_{friction} \;=\; m \; \frac{dv(t)}{dt}$$

$$F_{friction} \;=\; - \; \lambda \; v(t)$$

$$F_{ext} \;\approx\; \texttt{rand()}$$

in 2D

Non-charged particle in aqueous solution? **They *diffuse*!**

Which force field?

The diffusion-force created by a concentration gradient

- (non-zero) kinetic energy of water molecules at absolute temperature T >0° K
- (kinetic) energy exchanged with water molecules, due random isotropic collisions

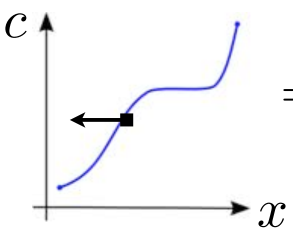
$$J \;=\; u\; c\; F_{ext} \qquad\qquad V(x) = R\;T\;\ln[c(x)]$$

$$J = u\;c\;\left(-R\;T\;\frac{d}{dx}ln[c(x)]\right)$$

R (gas constant) 8.3 J K^{-1} mol^{-1}

$$J \;=\; u\;c\;\left(-\;R\;T\;\frac{1}{c}\;\frac{dc}{dx}\right)$$

$\#\; particles\; m^{-2}\; s^{-1}$
$c\; in\; mM$



$$=\;-\;u\;R\;T\;\frac{dc}{dx}\;=\;\boxed{-\;D\,\frac{dc}{dx}}$$

Fick's law of diffusion

Particles - *distributed <u>heterogeneously</u> in space* - diffuse!

What kind of fluxes can occur in solution?

Diffusive fluxes

and

Drift fluxes

$$J = u\;c\;\left(-R\;T\;\frac{d}{dx}ln[c(x)]\right) \qquad\qquad J \;=\; u\;c\;\left(-\;z\;F\;\frac{dV}{dx}\right)$$
